Remarks: See §6.3.1, page 219 till 223 and example 2 and 4 on page 223 and 226

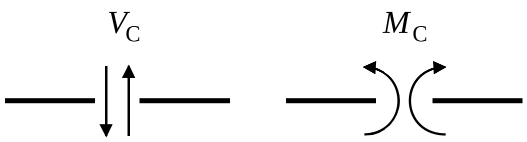
Replace the distributed load by its resultant on the part where the equilibrium is taken in consideration.

After calculating the support reactions the interaction forces in C follow from the equilibrium of one of the parts.

Between rigidly connected parts you've three interaction forces:

- A force in line with the beam. From the horizontal equilibrium it follows that this force is always zero here.
- A force perpendicular to the beam, called V_C here.
- A moment, called M_C here.

The positive directions for V_C and M_C



Answers:

In all cases $R = 10,8$ kN (↓) with the line of action 8 m from A.

1a. $A_h = 0$; $A_v = 3,6$ kN (↑)
1b. $B_v = 7,2$ kN (↑)
1c. $V_C = +0,9$ kN; $M_C = +16,2$ kNm

2a. $A_h = 0$; $A_v = 5,4$ kN (↑)
2b. $B_v = 5,4$ kN (↑)
2c. $V_C = +2,7$ kN; $M_C = +2,7$ kNm

3a. $A_h = A_v = 0$
3b. $B_v = 10,8$ kN (↑)
3c. $V_C = -1,2$ kN; $M_C = -1,6$ kNm
